

Reverse Voltage Protection and Under Voltage Lockout

Q3 provides protection in case of battery reversal.
Under voltage lockout is set at 2.2V and re-enable will occur at 2.4V. R1, R2, and R3 form a voltage divider that configures U1 as follows:
 $V_LOCKOUT = 1.24 * (R1 + R2 + R3) / (R2 + R3)$
 $V_ENABLE = 1.24 * (R1 + R2 + R3) / R3$

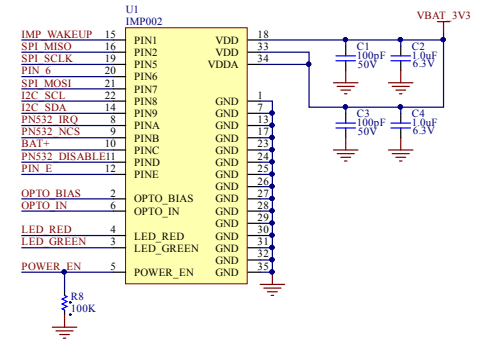

Power Supply

To save power when disabled we use Q3 to turn off the leakage path through the FB network.
Alkaline batteries can have a very high output impedance so we recommend at least 220uF on the battery input to support high current peaks.
R5 is a bleed resistor that is sized to drain C7 when the reset button is pressed.
